

OHSU Research Cores and Shared Resources

Proteomics

OHSU's cores are your campus technology partners dedicated to the success of your project. For optimal results, take advantage of the state-of-the-art scientific resources within the OHSU community.

www.ohsu.edu/cores

The Proteomics Shared Resource (PSR) provides expertise and instrumentation to assist the OHSU research community with mass spectrometric analysis of proteins.

Director

Larry David, Ph.D.

Associate Director

Ashok Reddy, Ph.D.

Informatics Specialist

Philip Wilmarth, Ph.D.

Instrument Specialists

Jennifer Cunliffe, Ph.D.
John Klimek, B.S.

Location

Medical Research Building
Room 521 and 524 3181 SW
Sam Jackson Park Road,
Portland OR 97239

Introduction

Proteomics, the global analysis of proteins in biological samples, is becoming an increasingly important discipline in biomedical research. The rapid advances in instrumentation and methodology requires centralization of facilities to enhance productivity, provide expertise, and control costs for investigators. The PSR provides access to the very latest instrumentation and techniques in proteomics to OHSU researchers. The highly experienced staff work collaboratively with students, post-docs and faculty to move projects to a successful completion.

Services

1. Analysis of differential protein abundance in complex mixtures using multinotch 11-plex TMT labeling on the Orbitrap Fusion.
2. Mass measurement of purified proteins and peptides to assess sample quality.
3. Protein identification from 1D gel bands and 2D gel spots.
4. Identification of protein-protein interactions in co-immunoprecipitated complexes.
5. Biomarker discovery in human serum/plasma, saliva, urine, cerebrospinal and amniotic fluid.
6. Analysis of exosomes from biological fluids.
7. Targeted quantitation of specific proteins in biological samples.
8. Detection and quantification of post-translational modifications, such as phosphorylation, acetylation, methylation, and ubiquitination.
9. Structural analysis of proteins, including disulfide bond localization and hydrogen deuterium exchange measurements.
10. In house informatics support for all experiments.
11. Assistance in grant submissions and preparations of manuscripts.
12. Partnering with investigators to secure new instrumentation to support emerging technologies.
13. Training in proteomics theory and practice.

Instrumentation/Informatics Support

- Orbitrap Fusion Tribrid instrument with ETD fragmentation
- Q-Exactive HF
- Two LTQ Velos linear ion traps
- Forte Bio Octet Red Biolayer Interferometer
- Nano and capillary HPLC and UPLC systems
- HPLC for sample prep (ion exchange, gel filtration, and reverse phase)
- Computers and a large suite of software for informatics support

Consultation and Preliminary Results

Free initial consultations with PSR staff are strongly encouraged before beginning projects. Limited funds for generation of preliminary data for new grant submissions are also available.
